What is a backup solution?

A backup system automates the process of backing up your important computer records and transferring them to a secure off-site location.

The backup software is installed on your server or computers and schedules are set to automatically back them up. This information is transmitted via a secure link using your internet connection to the backup vault.

What does a backup protect you from?

Ransomware/ cryptolocker	Natural disaster	Physical disaster	Theft
Human error	Computer virus	Hardware failure	Accidental loss

About us and our backup service:

Netcetera's N360 backup redundancy solution is one that ensures piece of mind in even the worst disaster scenarios. Using the very latest in backup technology, your data is securely replicated in blocks - keeping you and your business safe ensuring that your data cannot be tampered with at any point whilst in transit all the way to its resting place in our super-secure Datacentre storage location.

Our mission is simple - Provide a fast, easy-to-use, reliable and secure platform which will enable businesses to relax in the knowledge that they have an N360 solution.

Our secure backup client for:

Files & Folders

Photos, Word docs, Adobe files, CAD files, Program output, etc.

Emails & Calendars

Microsoft Exchange Server

Databases

MS SQL Server, MySQL

Servers & OS

Windows server system state, Windows System Backup, Application-Aware Writer, Hyper-V

How secure is our backup?

When our client backs up your data it secures it using AES-256 'military grade' encryption, from then onwards your data is encrypted at all points of the backup journey - from transit to our vault and finally at 'rest' in our storage. The only stage that your information is decrypted is when you need a restore.
